                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises a library of multimeric DNA binding polypeptides (e.g. zinc finger DNA binding polypeptides). The zinc finger binding polypeptides of the invention are useful for sterically occluding the binding site of a natural transcription factor and enhancing or silencing target gene expression. The present amino acid sequence represents a zinc finger DNA binding peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New zinc finger library of multimeric DNA binding polypeptides, useful for sterically occluding the binding site of a natural transcription factor, and enhancing or silencing target gene expression.

The ORFX proteins of the invention have a wide range of biological activities, such as cytokine, cell proliferation, cell differentiation, immune modulation, haematopoiesis regulation, tissue growth, angiogenesis, activin or inhibin activity, chemotactic/ chemokinetic activity, haemostatic activity, thrombolytic activity, receptor/ligand, antiinflammatory activity, thrombolytic activity, and antiinfective activity, and behaviour. ORFX proteins, or bodily characteristics, fertility and behaviour. ORFX proteins, activing a characteristics, fertility and behaviour.
                                                                                                                                                                                                                                                                                                other proliferative disorders such as psoriasis and benigh tumours, neurological disorders such as epilepsy and Alzheimer's disease, cardiovascular diseases, immune system disorders, disorders related to organ transplantation, disorders of tissue growth and regeneration, diseases such as diabetes mellitus, hypothyroidism, and cholesterol ester storage disease, and infectious diseases caused by viral, bacterial, fungal and other pathogens. ORFX nucleic acids may also be used as a source of primers and probes, in the detection of ORFX genomic sequences or transcripts, in the identification and cloning of homologous sequences, in genetic diagnosis, and in forensic biology. The ORFX nucleic acids may additionally be used to produce transgenic animals which may be useful for studying the function and/or activity of ORFX protein, and in drug soreening. The ORFX proteins may also be used as immunogens to generate specific antibodies, which are useful in the

AAB02894
    CC comprise 2-12, preferably 2-6, operatively linked motifs selected from CC sequences AAB02860-B02875. Sequences AAB02860-B02875 represent the alpha CC helical regions of zinc finger domains which specifically bind to target CC nucleotide triplets of the sequence 5'-GNN-3'. Such regions may be linked by the peptide linker TGEKP (AAB02970). The Cys2-His2 zinc finger motif CC is the most frequently utilised nucleic acid binding motif in eukaryotes, and constitutes a beta-beta-alpha fold. Nucleic acid recognition is CC achieved through specific contacts from side chains of amino acid CC residues in the alpha helix. Each zinc finger can recognise a subsite of 3 bp in target DNA. Covalent linkage of multiple zinc finger domains CC allows the recognition of extended contiguous asymmetric DNA sequences. CC for example, a synthetic polydactyl protein containing six zinc finger domains can recognise an 18 bp sequence, and such proteins are CC gene-specific transcriptional regulators. Such transcriptional switches CC may be used to regulate the expression of oncogenes such as erbB-2, overxpression of which is involved in malignant transformation. The corrections are therefore useful in the treatment of cancers, and may also the reatment of cancers, and may also
                                                                             be used to activate genes involved in fighting diseases, and to treat viral infections by inhibiting the synthesis of viral gene products. They may be used in DNA-based diagnostic applications. The proteins may also be used in producing functional gene knockout or activation in heterozygous transgenic animals. Proteins of the invention can discriminate between sequences which have a single base difference. This is manifested in a >100-fold decrease in affinity for the variant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polydactyl protein; asymmetric target recognition, gene repressor; gene specific transcriptional regulator; gene activator; gene repressor; transcriptional switch; oncogene; erbB-2; cancer; tumour; gene therapy; ranscenic animal; antiviral; anticancer; diagnosis.
                   sequence. Gene activation and repression can be achieved by targetting within the gene transcript, suggesting that information obtained from expressed sequence tags may be sufficient for the construction of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel isolated and purified zinc finge: specificity for GNN triplet sequences, regulating gene function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; Fig 1; 48pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (NOVS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  14-OCT-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                     The invention relates to an expression of nucleotide sequence that contains sequence 5'-(SNN)n-3', in which n is 1-6, is regulated by exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding polypeptide that contains a nucleotide binding region having a sequence of Gly-Cys-Arg-Glu-Leu-Val-Arg. The invention is used in the regulation of the expression of the nucleotide sequence that contains sequence 5'-(GNN)n-3'. The present sequence represents the amino acid sequence of a zinc finger binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Regulating expression of nucleotide sequence that contains sequence (GNN)n-3', comprises exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding
                                                                                                                                                                                                               Sequence 7

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          residues in the alpha helix. Each zinc finger can recognise a subsite 3 bp in target DNA. Covalent linkage of multiple zinc finger domains allows the recognition of extended contiguous asymmetric DNA sequences
                                                                                                            WPI; 2003-800134/75.

The invention is used in the regulation of the expression of the nucleotide sequence that contains sequence 5'-(GNN)n-3'. The present sequence represents the amino acid sequence of a zinc finger binding
                                                                                                                                                                                         The invention comprises a library of multimeric DNA binding polypeptides (e.g. zinc finger DNA binding polypeptides). The zinc finger binding polypeptides of the invention are useful for sterically occluding the binding site of a natural transcription factor and enhancing or silencing target gene expression. The present amino acid sequence represents a zinc finger DNA binding peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New zinc finger library of multimeric DNA binding polypeptides, useful for sterically occluding the binding site of a natural transcription factor, and enhancing or silencing target gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     library; multimeric DNA binding polypeptide; zinc finger DNA binding peptide; gene expression gene expression enhancement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 7 AA;

The invention relates to zinc finger nucleotide-binding proteins which comprise 2-12, preferably 2-6, operatively linked motifs selected from sequences AAB02860-B02875. Sequences AAB02860-B02875 represent the alpha helical regions of zinc finger domains which specifically bind to target nucleotide triplets of the sequence 5'-GNN-3'. Such regions may be linked by the peptide linker TGEKP (AAB02970). The Cys2-His2 zinc finger motif is the most frequently utilised nucleic acid binding motif in eukaryotes, and constitutes a beta-beta-alpha fold. Nucleic acid recognition is

Novel isolated and purified zinc finger nucleotide-binding proteins with specificity for GNN triplet sequences, useful in gene therapy and for

-!- FUNCTION: Cell wall formation.
-!- CATALYTIC ACTIVITY: ATP + UDP-N-acetylmuramate +
-!- CATALYTIC ACTIVITY: ATP + UDP-N-acetylmuramoyl-L-alanine.
-!- SUBCELLULAR LOCATION: Cytoplasmic (probable).
-!- SUBCELLULAR LOCATION: Cytoplasmic (probable).

Nature 417:459-463(2002).

-I- FUNCTION: Cell wall formation.
-I- CATALYTIC ACTIVITY: ATP + UDP-N-acetylmuramate + L-alanine = ADP + phosphate + UDP-N-acetylmuramyl-L-alanine.
-I- PATHWAY: Peptidoglycan biosynthesis.
-I- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-I- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cicarelli R.M.B. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Title:
Perfect score:
                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           US-10-646-919-35

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC comprise 2-12, preferably 2-16, operatively linked motifs selected from CC sequences AAB02860-B02875. Sequences AAB02860-B02875 represent the alpha CC helical regions of zinc finger domains which specifically bind to target CC by the peptide linker TGKKP (AAB0280)-B02875. Such regions may be linked CC is the most frequently utilized mucleic acid binding motif in eukaryotes, CC achieved through specific contacts from side chains of amino acid CC residues in the alpha helix. Each zinc finger can recognize a subsite of 3 bp in target DNA. Covalent linkage of multiple zinc finger domains CC allows the recognition of extended contiguous asymmetric DNA sequences. CC for example, a synthetic polydactyl protein containing six zinc finger CC domains can recognise an 18 bp sequence, and such proteins are injected for extended contiguous asymmetric DNA sequences. CC finger proteins may therefore be used in the development of artificial CC gene-specific transcriptional regulators. Such transcriptional switches contentially highly gene-specific The novel nucleotide-binding zinc contentially highly therefore be used in the development of artificial contentially highly gene-specific The novel nucleotide-binding zinc contentially highly gene-specific The novel nucleotide-binding zinc contentially highly gene-specific The novel nucleotide-binding zinc contentially highly gene-specific The content as such transcriptional switches contentially highly gene-specific. The novel nucleotide-binding zinc contentially highly gene-specific transcriptional regulators. Such transcriptional switches contentially highly gene-specific transcriptional regulators of oncogenes such as erbB-2, contentially highly gene proteins are therefore useful in the treatment of cancers, and may also be used in products provided in malignant transformation can be seen to treat the content of the invention can be used in products. They content the content of the conte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ADF61985

                                                                                                                                                                                                                                               The invention relates to an expression of nucleotide sequence that contains sequence 5'-(gNN)n-3', in which n is 1-6, is regulated by exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding polypeptide that contains a nucleotide binding region having a sequence of Gly-Cys-Arg-Glu-Leu-Val-Arg. The invention is used in the regulation of the expression of the nucleotide sequence that contains sequence 5'-(GNN)n-3'. The present sequence represents the amino acid sequence of a zinc finger binding

AAA65890 to AAA66055 and AAB15886 to AAB16040 represent nucleotide and protein sequences associated with E. coli proliferation. AAA66057 represent primers used for sequencing E. coli proliferation inhibiting nucleotide inserts in an example from the present invention. Methods from the present invention can be used to identify a proliferation-required gene in a microorganism, by contacting a microorganism with a proliferation-required gene activity inhibitory nucleic acid identified in another organism, and determining if inhibition occurs in the second microorganism. The nucleic acid sequences identified as being required for bacterial growth and proliferation, can be used for antisense therapy for killing bacteria
                         the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated
                                                                                                                                                                                                                                                      Claim 25;
                                                                                                                                                                                                                                                                                                                                          New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         21-MAR-2001; 2001US-00815242.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to provide a few produces of the traits to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at

A polymucleotide of the invent has anti-bacterial activity. The polypeptide can be used in detection and/or treatment of 0157:H7 infection. The nucleotide sequence of the genome of Enterohaemorragic E coli 0157:H7 was determined. The present sequence represents an E. coli 0157:H7-specific polypeptide of the
                     Novel polynucleotides and polypeptides associated with microorganism proliferation, used to identify inhibitors of bacterial growth and proliferation, for use in antisense therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to isolated polynucleotide (I) and polypeptide (II) creation (PCR) primers, oligomers, and for chromosome and gene mapping, creation (PCR) primers, oligomers, and for chromosome and gene mapping, compared in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed compared in the polynucleotides are also used in diagnosticy of (II) or to treat disease states involving (II). (II) is colypeptide in tissue, as molecular weight markers and as a food complement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The colypeptide and polynucleotide sequences have applications in colypeptide and polynucleotide sequences of the invention. Note: The sequence data for this camino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from MIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide and encoded polypeptides, useful diagnostics, forensics, gene mapping, identification of mutal responsible for genetic disorders or other traits and to assu

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ARR99314 is a rat MIPTP (protein tyrosine phosphatase-1) clone. A cDNA clone encoding this sequence was used as a probe to isolate a series of overlapping human cDNA clones defining the human MIPTP equivalent, SH-PTP1, which contains two tandem SH2 domains. A sequence complementary to nucleotides 537-653 of the SH-PTP1 gene clone given as ART35306 is used as a probe to detect a chromosome 12p13 abnormality associated with neoplastic disease, in partic. acute lymphoblastic leukaemia. The probe hybridises to a part of the region coding for the two tandem SH2 domains (see AAR39312). If the probe will not hybridise DNA of chromosome 12p13 from a patient sample it is indicative of an abnormality, normally associated with neoplasia. Fragments of sequences encoding human SH-PTP2 (see AAR35307) may also be used to disgnose a condition or susceptiblity to a condition associated with chromosome 12p abnormalities.

Alternatively the wild-type SH-PTP1 or SH-PTP2 gene or protein may be used for comparison to sequenced PTP genes taken from a patient, where purposely altered by mutation to effect a change in megakaryocyte function and hence platelet production. (Updated on 25-MAR-2003 to

                                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method for identifying a protein tyrosine CC phosphatase (PTP) that is reversibly oxidized in a cell by: (i) subjecting a sample, including a cell that contains at least one PTP, to conditions that cause reversible oxidation of PTP; (ii) isolating PTP anaerobically, in presence of a sulfhydryl-reactive agent (II) that crive irreversibly modifies the thiol group of an invariant Cys in the active site of PTP; and (iii) determining, under reducing conditions, the level of dephosphorylation, caused by PTP, of a labelled substrate (III), where CC dephosphorylation indicates that an active PTP is present. No details CC of tests for these activities are given. The method is used to identify creversibly oxidized PTP, also to identify agents that: (a) reversibly creversibly oxidized PTP, also to identify useful. (a) reversibly creversibly oxidized PTP, also to identify useful, in human or veterinary medicine, for treating abnormal cell proliferation or growth (cancer); guest vs. host disease; autoimmune diseases; allergy or other immunosuppressed states; metabolic diseases; and cell-cycle abnormalities. This sequence represents one of the PTP enzyme of the
                                                                                                                                                                                                                                                                                                                                                                                                Query Match

The primer given in AAQ67682 is used in the amplification of MPTP-H3/180 (given in AAR56994). (Updated on 25-MAR-2003 to correct PN

(protein tyrosine

phosphatase-1) clone

(revised) (first entry)

PTP; protein tyrosine phosphatase; SH2; Src homology region 2; chromosome 12p; abnormality; mutation; detection; probe; neoplasia; cancer; leukaemia; diagnosis; megakaryocyte regulation.

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) C sequences. (I) is useful as hybridisation probes, polymerase chain C reaction (PCR) primers, oligomers, and for chromosome and gene mapping, CC and in recombinant production of (II). The polynucleotides are also used C in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal CC useful for generating antibodies against it, detecting or quantitating a CC useful for generating antibodies against it, detecting or quantitating a CC upplement. (II) and its binding partners are useful in medical imaging CC involving aberrant protein expression or biological activity. The CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity CC and to produce other types of data and products dependent on DNA and CC amino acid sequences ABG00010-ABG30377 represent novel human diagnostic CC amino acid sequences of the invention. Note: The sequence data for this CC electronic format directly from WIPO at CC fip.wipo.int/pub/published_pct_sequences

The novel nucleotide-binding zinc finger proteins may therefore be used in the development of artificial gene-specific transcriptional regulators. Such transcriptional switches can be used to regulate the expression of oncogenes such as erbB-2, comay be used to regulate the expression of oncogenes such as erbB-2, coverexpression of which is involved in malignant transformation. The proteins are therefore useful in the treatment of cancers, and may also be used to activate genes involved in fighting diseases, and to treat viral infections by inhibiting the synthesis of viral gene products. They can be used in DNA-based diagnostic applications. The proteins may also be used in producing functional gene knockout or activation in can compare transgenic animals. Proteins of the invention can compare the sequence. This can be cancered the sequence. This can anifested in a >100-fold decrease in affinity for the variant can sequence discount to activation of gene expressed sequence tags may be sufficient for the construction of gene continued by targetting switches. Sequences AABO2B76-BO2B9 represent zinc finger alpha helix can be achieved by targetting switches. Sequences disclosed in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                        Regulating expression of nucleotide sequence that contains sequence (GNN)n-3', comprises exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ADF61984 standard; peptide; 7 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    achieved through specific contacts from side chains of amino acid residues in the alpha helix. Each zinc finger can recognise a subsite c by in target DNA. Covalent linkage of multiple zinc finger domains by in target DNA covalent linkage of multiple zinc finger domains allows the recognition of extended contiguous asymmetric DNA sequences.
                                                                                                                                                                     WPI; 2003-800134/75.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an expression of nucleotide sequence that contains sequence 5' (GNN)n-3', in which n is 1-6, is regulated by exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding polypeptide that contains a nucleotide binding region having a sequence of Gly-Cys-Arg-Glu-Leu-Val-Arg. The invention is used in the regulation of the expression of the nucleotide sequence that contains sequence 5'-(GNN)n-3'. The present sequence represents the amino acid sequence of a zinc finger binding
                                                                                   The invention comprises a library of multimeric DNA binding polypeptides (e.g. zinc finger DNA binding polypeptides). The zinc finger binding polypeptides of the invention are useful for sterically occluding the binding site of a natural transcription factor and enhancing or silencing target gene expression. The present amino acid sequence represents a zinc finger DNA binding peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     library; multimeric

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to zinc finger nucleotide-binding proteins which comprise 2-12, preferably 2-6, operatively linked motifs selected from sequences AAB02860-B02875. Sequences AAB02860-B02875 represent the alpha helical regions of zinc finger domains which specifically bind to target nucleotide triplets of the sequence 5'-GNN-3'. Such regions may be linked by the peptide linker TGEKP (AAB02970). The Cys2-His2 zinc finger motif is the most frequently utilised nucleic acid binding motif in eukaryotes, and constitutes a beta-beta-alpha fold. Nucleic acid recognition is

Novel isolated and purified zinc finger nucleotide-binding proteins with specificity for GNN triplet sequences, useful in gene therapy and for
